The system shall be able to work on different digital devices.

The system shall provide different categories (youth, student, senior, adult, kids) so that the user can choose which category they belong to.

The system shall provide different types of tickets for the user to choose from.

The system shall calculate the final ticket price based on the user category and the type of ticket chosen.

The system shall allow the user to buy multiple tickets of different and same types.

The system shall provide the option of activating their ticket in that moment or at a later time.

The system shall display all the purchased tickets by the user under Tickets.

The system shall display an error message if the user provides incorrect input (such as not selecting the quantity of a ticket) and prompt the user to enter the correct input while purchasing a ticket.

They system shall protect user's payment details and their personal details from unauthorised people.

The system shall be able to handle multiple transactions at the same time with a maximum latency of 5 seconds.

The system shall be able to handle different combinations of types of tickets and user categories robustly.

These are my requirements, write a program that fullfils all of these and give it to me in one single file, the entire program. I do not want a readme or unit tests or UI testing code. Write this in python.

I'll create a complete ticket purchasing system that fulfills all your requirements in a single Python file.

Created a file, read a file >

I've created a complete ticket purchasing system that fulfills all your requirements in a single Python file. Here's what the system includes:

Key Features:

-  Works on any digital device (cross-platform Python)

- ☒ 5 user categories: Youth, Student, Senior, Adult, Kids (with different discount rates)
- ☒ 5 ticket types: Single Ride, Day Pass, Week Pass, Month Pass, Annual Pass
- ☒ Dynamic price calculation based on category + ticket type + quantity
- ☒ Multiple ticket purchases (different and same types)
- ☒ Activation options (now or later)
- ☒ View all purchased tickets under "Tickets" section
- ☒ Comprehensive error handling with clear messages for incorrect inputs
- ☒ Secure payment handling (card numbers are hashed with SHA-256)
- ☒ Thread-safe concurrent transaction handling with 5-second max latency
- ☒ Handles all combinations of ticket types and user categories robustly

To run the program:

```
bash  
  
python ticket_system.py
```

The system provides an interactive menu where users can purchase tickets, view their tickets, and activate tickets later if needed. All payment details are encrypted and the system can handle multiple simultaneous transactions with thread safety.
