

Questions for participants

Section 1: Demographics & Experience

To be completed before starting the programming task.

1. **Current Status:** Are you currently a student or working in the industry? **I'm a student**
 2. **Field of Study / Job Title:** What is your major or current role? **Studying at GU, software engineering.**
 3. **Professional Experience:** How many years of professional experience do you have (including internships or full-time work)? **No experience.**
 4. **LLM Familiarity:** On a scale of 1–5, how frequently do you use AI tools (e.g., ChatGPT, Claude) for coding or software tasks? **3**
 5. **Requirements Engineering (RE) Experience:** Have you taken a course in RE or used formal specifications? If so, are you familiar with **IEEE 29148** or **User Story** structures? **Yes I have.**
-

Section 2: Post-Task Evaluation

To be completed after receiving the AI-generated code.

1. **Feature Coverage:** Describe the extent to which the AI-generated code implemented the functionality. Were there specific features missing? **I would say yeah. I would say, like, the way it generated the code, it generated the code, but it didn't consider the whole grand scheme of things. When I did the first prompt, it didn't even consider making the application scalable, and I had told it that there would be a lot of users using the application.**
2. **Coverage Gaps:** If the code did not cover all requirements, why do you think that happened? (e.g., prompt too vague, AI limitations, misinterpretation) **Maybe because the prompt was too vague and also, I don't know, because what I tried to do was I tried to make the initial prompt, like the summary so it has context, and then I give it more like detailed ones after that. Maybe the prompt should be more detailed. But also I feel like when you add too much, then it kind of starts breaking.**
3. **Coverage Confidence:** What specific evidence in the generated code gives you confidence (or lack thereof) that the requirements were met? **It's just, like the systems themselves are so large and it generated like two hundred lines of code. because writing programs myself, like whole entire programs myself, I know this is only gonna be like one file in a program.**

4. **Estimated Coverage:** What percentage of the requirements do you believe were successfully covered by the AI-generated code? (70 %) **I would say like seventy percent maybe.**
5. **Requirement / Vision Impact:** Which specific part of the Vision (or requirement for Group B) was most helpful in guiding the AI to handle the assigned task correctly?**I would say the requirements themselves because you're telling it, like, specifically what to build. Whereas the first one, you kind of just... It decides, you know? Whereas you have more autonomy in deciding what is included in the application by providing the requirements.**
6. **Challenges:**
 - **Intuitive:** Did you find the vision text too broad or unclear for writing an effective AI prompt? Please describe. **Maybe for just three prompts, maybe have it be a little bit more detailed. But I don't know, like, I don't know what you expect the output to be, you know.**
 - **REQC-Guided:** Did you encounter difficulties translating the vision into structured requirements? Please describe. **Yes, there were some challenges in translating the vision, but structuring it made it easier to ensure all relevant requirements were clearly identified and included.**
